Regular Expressions

Common Errors

Line Count Example

Interactive Flex

Flex-Bison Flow

Start Conditions

Summary

Expr.	Meaning
x	Character x
.	Any character except newline
[xyz]	Any characters amongst x, y or z.
[a-z]	Denotes any letter from a through z
[^0-9]	Stands for any character which is not a decimal digit, including new-line
\x	If x is an a, b, f, n, r, t, or v, then the ANSI-C interpretation of \x. Otherwise, a literal x (used to escape operators such as *)
\0	A NULL character
\num	Character with octal value num
\xnum	Character with hexadecimal value num
"string"	Match the literal string. For instance "/"* denotes the character / and then the character *, as opposed to /* denoting any number of slashes
<<EOF>>	Match the end-of-file

Regular Expressions

Common Errors

Line Count Example

Interactive Flex

Flex-Bison Flow

Start Conditions

Summary

Expr.

Meaning

quantifiers

r^*	zero or more r 's
r^+	one or more r 's
$r^?$	zero or one r 's
$r\{[num]\}$	num times r
$r\{min,[max]\}$	Anywhere from min to max (defaulting to no bound) r 's
r/s	Match an r but only if it is followed by an s . This type of pattern is called <i>trailing context</i> .

For example: Distinguish $DO1J=1,5$ (a for loop where I runs from 1 to 5) from $DO1J=1.5$ (a definition/assignment of the floating variable $DO1J$ to 1.5) in FORTRAN. Use

$DO/[A-Z0-9]^*=[A-Z0-9]^*$

r	Match an r at the beginning of a line
$r\$$	Match an r at the end of a line

Wrong Flex Specs for our sample

- Rules for ID and INT have been swapped.
- No keyword can be tokenized as keyword now.

```
%{

Flex Specification
Sample

Regular Expressions

Common Errors

Line Count Example

Interactive Flex

Flex-Bison Flow

Start Conditions

Summary

Flex can be used in two modes:

- **Non-interactive:** Call `yyllex()` only once. It keeps spitting the tokens till the end-of-file is reached. So the actions on the rules do not have `return` and falls through in the `switch` in `lex.yy.c`.
This is convenient for small specifications. But does not work well for large programs because:
 - Long stream of spitted tokens may need a further tokenization while processed by the parser
 - At times tokenization itself, or at least the information update in the actions for the rules, may need information from the parser (like pointer to the correctly scoped symbol table)
- **Interactive:** Repeatedly call `yyllex()`. Every call returns one token (after taking the actions for the rule matched) that is consumed by the parser and `yyllex()` is again called for the next token. This lets parser and lexer work hand-in-hand and also eases information interchange between the two.

token, yytext); break;  
case LBRACE: printf("<SPECIAL SYMBOL, %d, %s>\n",  
token, yytext); break;  
case RBACE: printf("<SPECIAL SYMBOL, %d, %s>\n",  
token, yytext); break;  
case SEMICOLON: printf("<PUNCTUATION, %d, %s>\n",  
token, yytext); break;  
case CONST: printf("<INTEGER CONSTANT, %d, %s>\n",  
token, yytext); break;  
}  
}  
}
```

- Input is taken from stdin. It can be changed by opening the file in main() and setting the file pointer to yyin.
- When the lexer will be integrated with the YACC generated parser, the yyparse() therein will call yylex() and the main() will call yyparse().

Flex-Bison Flow

Start Conditions

Summary

Flex provides a mechanism for conditionally activating rules. Any rule whose pattern is prefixed with `<sc>` will only be active when the scanner is in the start condition named `sc`. For example,

```
<STRING>[~"]*      { /* eat up the string body ... */  
                    ...  
                    }
```

will be active only when the scanner is in the `STRING` start condition, and

```
<INITIAL,STRING,QUOTE>\. { /* handle an escape ... */  
                          ...  
                          }
```

will be active only when the current start condition is either `INITIAL`, `STRING`, or `QUOTE`.

Start Conditions

Summary

- *Declaration*: Declared in the definitions section of the input
 - *BEGIN Action*: A start condition is activated using the BEGIN action. Until the next BEGIN action is executed, rules with the given start condition will be active and rules with other start conditions will be inactive
 - *Inclusive Start Conditions*: Use unindented lines beginning with '%s' followed by a list of names. If the start condition is inclusive, then rules with no start conditions at all will also be active
 - *Exclusive Start Conditions*: Use unindented lines beginning with '%x' followed by a list of names. If it is exclusive, then only rules qualified with the start condition will be active
- A set of rules contingent on the same exclusive start condition describe a scanner which is independent of any of the other rules in the flex input. Because of this, exclusive start conditions make it easy to specify mini-scanners which scan portions of the input that are syntactically different from the rest (for example, comments)

Line Count Example

Interactive Flex

Flex-Bison Flow

Start Conditions

Summary

The set of rules:

```
%s example
%%
<example>foo    do_something();
bar             something_else();
```

is equivalent to

```
%x example
%%
<example>foo    do_something();
<INITIAL,example>bar    something_else();
```

Without the `<INITIAL,example>` qualifier, the bar pattern in the second example wouldn't be active (that is, couldn't match) when in start condition example. If we just used `<example>` to qualify bar, though, then it would only be active in example and not in INITIAL, while in the first example it's active in both, because in the first example the example start condition is an inclusive (`%s`) start condition.
